

Biohazards are materials or human waste that cause infections or disease. If you work in areas with wastewater, medical waste, or live sewer lines, for example, you should assume that all surfaces are contaminated.

# Biohazard Safety

Avoid direct contact with sewage. Use liquid-proof gloves, boots, and face protection if you will have direct contact with raw sewage. Use a face shield if you might get splashed.

Wash your hands well to prevent spreading contaminants. Clean, treat, and report any cuts or wounds immediately, because they could be infected.

Keep contaminated gloves, boots, face protection, and other equipment away from areas where food is eaten or stored.
